

Altomed Limited – Reprocessing Reusable Stainless Steel and Titanium Devices.

- The following instructions and guidance relate to Altomed Limited reusable stainless steel, titanium and ceramic coated stainless steel instruments. Any separate instructions for use supplied with the device itself should also be followed.
- Instruments with Tungsten Carbide inserts will have a gold coloured handle.
- These procedures should be followed when cleaning and sterilizing the aforementioned Altomed reusable instruments.
- The devices should be monitored, controlled, handled, cleaned and processed by suitably trained and qualified personnel under an approved quality management system such as ISO 9001 or ISO 13485.
- Follow Department of Health and MHRA Guidance where appropriate.
- Processing systems used must be able to sterilize devices to EN 556.
- The instructions provided below have been validated by Altomed as being capable of preparing a medical device for re-use. It remains the responsibility of the processor to ensure that the processing as actually performed, using equipment, materials and personnel in the processing facility achieve the desired result. This requires validation and routine monitoring of the process. Likewise, any deviation by the processor from the instructions provided should be properly evaluated for effectiveness and potential adverse consequences.
- NOTE: Pure water Water that has been demineralised, deionised, distilled or processed through reverse osmosis.

If in any doubt as to these instructions, contact the Quality Department at Altomed Limited.

Warnings 1: Solution	s and materials and equipment		
1.1 Stainless steel.			
Avoid contact with:	Salt solutions e.g. ammonium chloride, mercury salts and stannous chloride.		
	Potassium thiocyanate and potassium permanganate.		
	Limit contact with iodine solutions to less than 1 hour.		
1.2 Titanium.	Potassium Perchlorate.		
Avoid contact with:			
1.3 Tungsten	Exposure to Benzyl Ammonium Chloride (BAC) may loosen tungsten carbide inserts.		
carbide.			
1.4 Corrosion and	Localised corrosion can be caused by Chloride-bearing solutions such as blood and saline. Avoid		
pitting.	prolonged rinsing in saline solutions and use pure water instead.		
1.5 Detergents.	Use only detergents that have been CE marked for cleaning stainless steel and titanium		
	instruments. Repeated exposure to strong alkaline solutions may cause discolouration of the device.		
	Take into account local water hardness levels when selecting the detergent.		
1.6 Materials and	Avoid the use of abrasive pads or cleaners. Use only cleaning materials and equipment that have		
equipment.	been CE marked for processing stainless steel and titanium medical devices.		
Warning 2: Processi			
2.1 Instructions for	Follow instructions for use and warnings issued by the detergent manufacturer. Ensure all detergent		
use.	residues are rinsed off as this may result in spotting or staining		
	Follow instructions for use and warnings issued by the ultrasonic/washer/disinfector manufacturer.		
2.2 Temperatures.	No part of the process should exceed 137°C. To prevent coagulation of proteinaceous substances,		
	the initial cleaning/rinsing should not exceed 45°C.		
2.3 Difficult to clean	Due to the intended use of the device, some instruments may be difficult to clean. Devices with a		
devices.	long narrow lumen should be flushed using a Q-Rinse Machine or syringe with pure water. If still not		
	clean use a chemical brush specifically designed for use on lumen devices e.g. Ruhof InstruSponge.		
	Suitable CE marked medical device brushes may be used if needed.		
	Devices with complex specifications, e.g. closed pressure jaws, small bowl jaws etc. should be		
	manually cleaned first with a suitable CE marked medical device brush.		
2.4 Handling	Altomed medical devices are VERY delicate and must be handled with care at all times by suitably		
I	trained staff. Do not bang or drop devices or knock devices against each other as this may damage		
N/4 1/11	their structure or cutting edges. Avoid undue stresses or strains on the devices during processing.		
☆ ←	Do not allow devices to remain wet, store clean and dry. Keep sterilized devices out of direct		
	sunlight and away from moisture.		
8	Do not use sterilized medical devices if the packaging has been compromised.		
Warnings 3: Cross c			
3.1 High risk	Follow hospital/facility approved procedures or recommendations in "Transmissible Spongiform		
patients.	Encephalopathy Agents: Safe Working And The Prevention Of Infection" compiled by the Advisory		
	Committee on Dangerous Pathogens Spongiform Encephalopathy Advisory Committee for		
	processing devices that have been exposed to unconventional slow viruses or prion diseases such		
	as Creutzfeldt Jakob Disease (C.J.D), Kuru, Gerstmann-Straussler-Scheinker Syndrome (G.S.S.),		
	Fatal Familial Insomnia (F.F.I.), Scrapie, Bovine Spongiform Encephalopathy (B.S.E.) etc.		
	Segregate instruments used on high risk tissues for patients born after 1st January 1997. See NICE		
0.0115-105-5-4	IPG 196 (2006)		
3.2 Health and	Follow hospital/facility approved Health & Safety procedures at all times (e.g. C.O.S.H.H., P.P.E.		
safety	etc.). Wear protective clothes, gloves and eye wear as specified in your Health and Safety procedures. Keep fingers away from sharp tips and edges, use extreme caution when handling		
Warnings 4: Use	sharp devices.		
4.1 Intended use	Instruments should only be used for their intended purpose, e.g. clamping, cutting, retracting etc. Do		
T. I IIIICIIUCU USC	not use scissors for the wrong job as blades may misalign, blunt or chip. Use tissue scissors only for		
	cutting tissue and not sutures, wires etc. Do not use needle holders as pliers. Extra care should be		
	taken with delicate microsurgical instruments; these should be protected when not in use e.g.		
	MicroWash Tray.		
L			

4.2 After use	An instrument count should be made before and after surgery to ensure no devices are missing.
	Ensure instruments are not caught in soiled linen as these will create an injury hazard at the laundry
	and may become damaged beyond repair.

5. Limitations on Rep	processing
5.1 Shelf Life	For reusable devices that have been presented for use in a sterile condition, ensure the use by date has not been exceeded. The use by date is in the format of Year/Month/Day and is displayed next to the hour glass symbol.
5.2 End of life	Repeated processing has minimal effect on these instruments. End of life is normally determined by wear and tear and damage due to use, processing or handling. Any specific limitations on the number of processing cycles is identified on the product labelling or instruction sheet provided with the device. Devices will withstand over 20 autoclave cycles unless specified elsewhere on the label. Devices should be inspected (under a microscope if necessary) and tested to ensure they have not been damaged and function correctly. See Inspection and Testing below. If the device fails, it should be segregated, identified accordingly and decontaminated. It should then be either sent back to Altomed for repair along with the signed Decontamination Certificate, or disposed of following hospital approved procedures, e.g. Sharps Bin or Clinical Waste etc
5.3 Reprocessing single use devices	If the Altomed device or packaging is labelled with a single use symbol, then this device is intended to be used only once. Single use devices must not be reprocessed but disposed of after use following hospital approved procedures, e.g. decontamination, sharps bin, clinical waste bin etc.

	oparation at point	of use		
6. Processing 1: Pr			and an other headily flyide) to dry on the devices. For	
6.1 Point of use	Wherever possible do not allow debris (e.g. blood or other bodily fluids) to dry on the devices. For best results and to maximise instrument life, process as soon as is reasonably practical after use.			
		Follow any separate instructions for use supplied with the device in question.		
			rgery are reprocessed, even if they were not used as

Ensure solution tion, brush, wipe and agitate the item to dislodge any rations, teeth, ratchets, hinges or other difficult to clean	

Transfer item to the second sink. Ensure the device is fully immersed and rinse thoroughly with the pure water to remove any residues in both open and closed positions. Flush any lumen with a MicroWash Q-Rinse Machine and pure water to ensure correct flow rates. Carefully hand dry using instrument wipe or hospital approved tissue paper, an industrial hot air dryer, drying cabinet or filtered air gun can also be used. If necessary, use medical grade compressed air to dry any cannulated devices. aning - Ultrasonics 9. Processing If specified in the Altomed instructions for use supplied with the device or elsewhere in these 9.1 Ultrasonic cleaning procedures, ultrasonically clean the instrument Warning! Do not process plated instruments (e.g. Lang Speculum) or ceramic coated devices in the ultrasonic as this may crack or rupture the surface. CE marked and validated Ultrasonic bath and basket, suitable sized CE marked Required equipment processing trays such as MicroWash Tray, pure water. CE marked endozyme detergent, which is a liquid, low foaming, free rinsing, nonabrasive and biodegradable. It should not contain artificial colours, optical brighteners, perfumes, halides at an in concentration >120mg/L, fatty soaps, glycerine or lanolin or leave a toxic residue. Altomed used Ultrasonic bath, MicroWash Tray, Ruhof Endozyme AW Plus detergent and pure water Temperature range 20°C to 45°C Time Minimum 2 minutes Dilution ratio 17 millilitres detergent / 4 litres of water Ensure the Ultrasonic Machine is clean, empty and dry and has been approved for use. Fill fluid reservoir with solution of detergent and water to ensure complete immersion of device. Follow the Detergent and Ultrasonic Cleaner Manufacturer's instructions for use. Acidic or alkaline products with >2% available alkalinity is not recommended as they cannot be properly neutralised Degas the solution by following the machine manufacturer's instructions for use. Set and wait until the temperature is at the required level as specified in the detergent manufacturer's instructions Protect the devices by packing them in MicroWash Trays, Ultrasonic trays or cassettes, on finger matting or specially made holders to prevent them touching each other or the sides and bottom of the Ultrasonic bath. Ensure loading pattern has been validated and is as the machine manufacturer's instructions. Ensure all box locks and jaws are open, lumen and holes are set at an angle to drain, do not allow instruments to touch each other. Carefully place items into the solution using the machine basket. Ensure items are fully immersed and that any air contained in the device is displaced. Replace lid and leave for the time required. When the cycle is finished, switch off the cleaner, remove the instruments and drain them. Rinse thoroughly in pure water to remove any residues; NOTE: ensure any lumen are flushed thoroughly. The Ruhof Endozyme has been clinically tested to be free rinsing. Carefully hand dry using absorbent non-shedding cloth, alcohol wipe, industrial hot air dryer or drying cabinet. If hand drying, dry from the stock of the device to the tips, ensure care is taken so that delicate items such as tips, probes, hooks, dilators etc. are not damaged. If necessary, use medical grade compressed air to dry any cannulated devices. Inspect and test prior to further processing. 10. Processing aning - Washer Disinfector Suitable sized CE marked processing trays - Do not use Radel (plastic) 10.1 Automated Recommended cleaning sterilization trays in the washer / disinfector as they do not permit correct exposure equipment to the process. CE marked and validated washer / disinfector machine to ISO15883 CE marked detergent which is a liquid, low foaming, free rinsing, biodegradable and non-abrasive. It should not contain artificial colours, optical brighteners, perfumes, halides at an in concentration >120mg/L, fatty soaps, glycerine or lanolin or leave a toxic residue. Validated Washer / Disinfector, MicroWash Tray, either (1) HAMO Liquid 52 Neutral Enzymatic; or, (2) Prolystica 2X Alkaline detergent and pure water Stage Temperature Format Time Initial rinse / Pre-wash (1) <45°C Filtered water 2 minutes (2) <20°C 60°C Detergent wash ((1) 60ml per cycle 6 minutes ((2) 2.0ml/L Detergent rinse <45°C Pure water, soft high 15 seconds purity water controlled for bacterial endotoxins Disinfection cycle Min. 90°C Heat 1 minute Drying cycle Sufficient to Hot clean air that does >12 remove all not introduce microbial minutes remaining contamination or impair the cleanliness of the surface moisture device Ensure any handwashing or Ultrasonic Cleaning has been carried out if specified on the device manufacturers instructions for use Place instruments into a suitable container (e.g. MicroWash Tray) that has been validated for use with the washer / disinfector to protect devices from handling damage that can occur during processing. Especially ceramic coated devices! Ensure instruments are in their correct location in the MicroWash Tray and that the lid is on the correct way around and locked closed if applicable. If no MicroWash Tray is used, load instruments so that as much contaminated surface area is exposed as possible, e.g. open jaws, hinges etc. Place any devices with holes, lumen, concave

surfaces, box joints etc. so that they can drain freely. Load the machine as specified in the machine manufacturer's instructions so that the load configuration does not impede the cleaning process.

Keep heavy objects at the bottom of trays, do not overload baskets and do not let instruments touch each other. Load as described in hospital/facility procedures or as in the MicroWash Tray Plan.

Where available use machine attachments to flush the lumen of any cannulated devices.

Run a cycle that has been approved and validated by the hospital/facility. The initial rinse should be at or below 45°C. The hot water disinfection rinse should ensure the surface of the device reaches 90°C for a minimum of 1 minute (see also ISO 15883-1).

When unloading check devices, including cannulations and holes etc. for complete removal of visible soil. If necessary, test lumen flow rates using a Quickrinse Machine or syringe and pure water. If necessary, repeat cycle or carry out manual cleaning.

Ensure instruments are dry, if not they should be reprocessed.

11. Sterilization			
11.1 Packaging	All delicate devices must be packed in a suitable MicroWash Tray or specially designed Sterilization Tray to prevent any damage, especially to tips. Wrap the MicroWash Tray or Sterilization Tray in a hospital approved wrap or in a peel pouch as specified by under local protocols. Altomed recommend the use of wraps or pouches that meet the requirements of the current harmonised standards (E.g. BS, EN, ISO.).		
11.2 Sterilization	Follow local protocols to Department of Health Guidance for autoclave sterilization. Altomed have validated the following autoclave protocol as shown below:		
	Autoclave	Vacuum Autoclave	CE marked and maintained to Department of Health Guidance
		Water	Pure water
		Holding Time (E.g. Sterilization time)	3 to 31/2 minutes
		Sterilization temperature	134°C to 137°C
Label device once	Load the autoclave as described in the autoclave manufacturer's instructions for use, do not overload.		
sterilized with "sterile" symbol	Ensure the autoclave has fully finished the cycle before opening the door. Failure to do so may result in wet product. All product and packaging must be dry when the autoclave cycle has finished. If not, they should be reprocessed and the autoclave reviewed for suitability. Label device as sterile.		
Other forms of sterilization are available such as ethylene oxide and gamma etc., please Altomed Quality Department at quality@altomed.com for further details.		xide and gamma etc., please contact the	

12. Maintenance, ins	spection and tes	sting.		
12.1 Reassembly	Reassemble any devices where necessary if the instructions supplied with the device specify this. Follow the instructions supplied with the device to assemble correctly. If applicable, ensure any sharp tips have a protective cover to prevent puncturing sterilization pouches.			
12.2 Lubrication		and before sterilization, lubrication should be applied to moving parts or joints for		
		w threads, hinges, moving blades, moving platforms, moving arms etc.		
		Follow the Lubricant Manufacturer's instructions. Any lubricants used must be water soluble and		
	Ruhof Premix			
		icants should not be used. They deliberately cause contamination over the entire		
		cleaned surface. Mineral oils have poor biocompatibility and may inhibit the penetration of steam or		
10.01	sterilant gases on terminally sterilized product.			
12.3 Inspection		ct all surfaces, cannulations, ratchets, joints, holes and lumens for complete removal such as organic matter and any chemical residues. If devices are not visibly clean,		
		ng manual cleaning or automated cleaning as necessary. Use a microscope if		
	necessary to			
		It the integrity of cannulated device flush with pure water and check the flow rate.		
12.4 Testing		7151 and BS 5194 Parts 2, 3 and 4. If applicable follow any additional inspection and		
		cified on the device's instructions for use. If you have any questions on device testing,		
	please contac	please contact Altomed Quality Department on quality@altomed.com.		
	Alignment	All jaws, teeth, arms etc. should be correctly aligned and interlock where		
		appropriate.		
	Finish	Device should be clean with no staining, chemical or cleaning residues or body		
		fluids or debris. Any markings should be clear and easily visible. Staining may be		
		removed by using a specially designed cleaning agent such as Ruhof Surgi-Stain.		
	Structure	Follow cleaning agent instructions for use. Re-clean where applicable. No scratches, bends, distortions, chips, cracks, flaking, grinding marks, pitting or		
	Structure	other signs of physical or handling damage. Sharp edges should only be where		
		designed, e.g. blades. Check also for any cracks in box locks and hinges and		
		excessive wear. Ensure any ceramic coated devices have not become chipped or		
		cracked and any lockable platforms have not been bent out of shape.		
	Movement	Smooth without grating, scratching, jerking or excessive play unless designed to be		
		otherwise. Should be easy to open and close with two fingers without catching.		
		Screw actions should be smooth without any gritty action. Moveable fixation rings		
		should move easily under pressure yet remain stationary when not.		
	Locking Mechanisms	Should open and closed easily. Should hold jaws in the position required securely when in the locked position.		
	Tips and	Check the integrity of any delicate parts on probes, hooks, dilators etc. Ensure any		
	teeth	tips or teeth are not bent, snapped, missing or otherwise damaged (see also		
		alignment). Teeth and prongs should be appropriately sharp and equally shaped		
		where applicable with no resistance when reopening. Any tips normally held under		

		pressure in a closed position, should interlock and remain closed unless operated. These tips should open correctly with pressure applied by two fingers.
	Assemblies	All interlocking and detachable parts should fit easily and correctly without the need to apply any excessive force
	Cutting edges	Should give a clean cut from the tip down to two-thirds of the blade. Test by cutting moist tissue paper in a single continuous movement, do not apply lateral pressure. Cut should be clean and not pull tissue fibres when the closed blades are retracted from the paper.
	Interlocking arms or platforms	Any serrations and interlocking parts should mesh when in the closed position. Bulldog clip jaws and needle holder jaws should apply sufficient pressure to securely hold a suture. DCR punch arms should be correctly connected to ensure smooth movement. Ball and socket towel clip ends should fit each other. Tungsten carbide platforms should be securely attached with no gaps around the join.
12.5 Failed devices	If the device fails any of the quality inspection criteria above it should be segregated, identified accordingly and decontaminated. It should then be either sent back to Altomed for repair along with the signed Decontamination Certificate, or disposed of following hospital approved procedures, e.g. Sharps Bin or Clinical Waste etc

Symbols Used to BS EN ISO 15223-1 and ASTM F 2503:

If this symbol is on the device label do not reprocess or reuse – Single use

Keep away from direct sunlight and store dry

These reusable devices are non-sterile Sterilize before use

Fragile handle with care

Do not use if packaging has been damaged

Date of manufacture

Name of manufacturer

Lot number

Product code number

Use by Date

Caution see IFU warnings

Meet requirementsfor CE marking in the EU

The product is sterile if this symbol is on product label

US Statement.

Caution: Federal law restricts this device to sale, distribution and use by or on the order of a Physician trained and/or experienced in the use of this device.
